

Go beyond compliance. Measure, manage, and report sustainability performance indicators to your key stakeholders.

Connect sustainability to core business strategy.

The goal of sustainable development is to “meet the needs of the present without compromising the ability of future generations to meet their own needs.” Capturing and reporting Key Performance Indicators (KPI’s) is the practice of measuring, managing, and reporting for organizational performance towards the goal of sustainable development. KPI’s are used in sustainability and corporate social responsibility (CSR) reports providing a balanced and reasonable representation of the sustainability performance of a reporting organization.

And that’s just the beginning. You now must provide greenhouse gas and carbon emissions data to regulators and important non–government organizations (NGO’s). Understanding how your company’s performance impacts the environment is critical. That’s why the world’s largest corporations and government agencies use the Enviance Environmental ERP System to measure, manage and report environmental data and performance.

COMMIT to Sustainability

An organization identified as committed to a sustainable future pays big dividends – in public perception, shareholder value, global stewardship and operational efficiencies achieved. Implementing production and distribution systems that reduce energy consumption and emissions, prevent or reuse waste products and minimize the overuse of natural resources is not just the right thing to do – it’s a competitive advantage.

The Enviance Environmental Enterprise Resource Planning (EERP) System helps organizations measure, manage and report sustainability metrics and key performance indicators (KPIs) across their local and global operations facilitating the effective management of:

Corporate Strategy

- Protect and enhance your brand with positive news about sustainable business practices
- Increase market valuation by leveraging environmental stewardship as an asset

- Improve financial performance by lowering the cost of collecting, analyzing and reporting sustainability data and avoiding fines, fees and penalties

Business Operations

- Achieve reduction targets – you can’t manage what you can’t measure
- Improve accuracy and timeliness of reports by entering data once and using it for multiple purposes
- Standardize metrics across business units using a centralized data repository

Local Production and Distribution

- Reduce expenses for sustainability management by automating data collection, analysis and reporting
- Improve quality of reporting through data consistency, accuracy and verifiability
- Reduce exceptions, violations and errant data using an automated system of notifications and alerts

MANAGE DISPARATE DATA in One Central System

Companies today need more than the ability to produce reports – they need to understand how their environmental performance impacts their business.

The Enviance Environmental ERP System helps companies manage a large body of disparate environmental key performance indicators, including materials, energy, water, biodiversity, emissions, effluents, and wastes, energy, products and services, compliance, transportation and other. The System provides a balanced, comparable, accurate, timely, and clear understanding of your environmental performance and its impacts on your business and society.

The System can connect with other sources of relevant data, such as process historians, fuel databases, ERP software and more, to efficiently and effectively collect data once, but report it multiple times. In addition, the System can collect and report on a company's economic and social performance metrics – making environmental performance tracking and reporting easier than ever.

ACCURATE & VERIFIABLE Data

Most companies today generate high-level estimates of environmental KPI's to include in Sustainability and CSR reports. But in today's landscape of heightened financial, regulatory and public scrutiny, estimates are not enough. Enviance enables complete coverage of scope, boundary, and time. Without a comprehensive Environmental ERP System like Enviance, it would be virtually impossible to centrally measure, manage and report KPI's enterprise-wide.

Many sustainability software providers simply aggregate data once it has been manually fed into a system. But drilling down and reporting on inaccurate data is pointless. The Enviance System provides a closed-loop process from data capture through reporting by leveraging a data collection, conversion, and calculation engine that enables one system to be used to both gather and process data. As a result, the delivery of data – when using Enviance – is a valid process derived directly from the business requirement.

In an era of increased efficiency needs and reduced workforces, Enviance collects and verifies data, allowing personnel to spend their time analyzing data – not wasting time

collecting and verifying it. Companies using the System can rest assured that the sustainability information they report is accurate – and valid.

SOLVE Sustainability Reporting Problems

With more than 10 years of environmental expertise, Enviance – the world's most trusted system – uses cloud computing technology to provide enterprise-wide access and real-time availability to help companies manage their sustainability data. As such, the System is deployed quickly and can be easily configured to meet a company's specific needs. And since Enviance solutions are delivered online, they can be seamlessly adjusted to meet changing business requirements. Enviance provides comprehensive solutions to face sustainability reporting issues and solve the most pressing environmental performance problems.

“Syngenta selected Enviance, because it offers a full service package without taxing our IT department. In addition, the platform's flexibility allows for easy data entry, comprehensive reporting, and scalability. With Enviance as our central, standardized information system, we have ensured the quality and reliability of our CSR and GHG data, and have substantially reduced the cost of collecting, managing and responsibly reporting this data from the 37 countries in which we operate.”
